1 Introduction

This final project was about making a personal portfolio by creating a website using HTML and writing a CV. I am planning on using this website to build my online portfolio as I gain more experience over time. With this report, I will explain in detail the general process of making a website using HTML.

2 Planning and Process

First things first, I needed a plan to decide which part of the project to start with. I settled on the idea of writing the CV so that I would know what information I can include on the web page as well. After writing the CV, I started on making the website. I used Visual Studio Code to make the website from scratch. I was having troubles with how the web page looked with just using HTML5, so I looked over various templates to utilize with my code. I found a program called NicePage Desktop which helped me create a better-looking website with the help of CSS (Nicepage, 2024). After some detailing, tweaking, and testing, the website was successfully up and running.

3 Conclusion

In conclusion, I am planning to keep on using this online portfolio and website in the future. By keeping it updated and improving it step by step, it will become more interactive, utilizing JavaScript as I learn and grow more into this subject. But as I don't have much experience right now, it will be fuller and more informative in my future use.
